3 At 2:10 p.m.

4  
 5 STUART BATTERMAN  
 6 HAVING BEEN CALLED BY THE DEFENDANT AND SWORN:  
 7 MARKED BY THE REPORTER:  
 8 DEPOSITION EXHIBIT NUMBER 1001  
 9 EXAMINATION

10 BY MS. CRABTREE:

11 Q. Good afternoon, Mr. Batterman. Could you please state  
 12 your name for the record.

13 A. Stuart Batterman.

14 Q. Mr. Batterman, Dr. Batterman, where are you employed?  
 15 A. I'm employed at the University of Michigan.

16 Q. How long have you been there?

17 A. Since 1989.

18 Q. I have marked, just for the record, the protective  
 19 order in this case, which was previously marked as  
 20 1001. This is not something that you would have  
 21 necessarily seen before, but we mark it just in case,  
 22 in all of the depositions, in case there is any  
 23 sensitive business information, either for you or the  
 24 defendant in this case, that we have an opportunity to  
 25 mark that later as confidential.

## 1 I N D E X

2 WITNESS: STUART BATTERMAN, PH.D. PAGE NO.

3 Examination by Ms. Crabtree 3

## 4 EXHIBIT INDEX

EXHIBIT NO.	DESCRIPTION	PAGE NO.
1001	Protective Order	3
1075	Dr. Batterman's resume	5
1076	Deposition Notice	9
1077	Subpoena	10
1078	Dr. Batterman's report	13
1079	Table summary Ambient Air Sampling	20
1080	Lab information	21
1081	Industrial hygiene analysis PowerPoint presentation	33

1 Have you ever been deposed before?

2 A. Yes.

3 Q. How many times?

4 A. At least three, I think, maybe four.

5 Q. What were the circumstances of those depositions?

6 A. Those are different cases dealing with environmental  
 7 matters.

8 Q. What type of environmental matters?

9 A. Pollution cases, for the most part.

10 Q. Anything dealing with sulfuric acid?

11 A. Sulfuric acid was involved slightly in one of the  
 12 cases. It was mostly SO2.

13 Q. Can you describe the circumstances?

14 A. Sure. In the December period, I think of '95, a large  
 15 pile of elemental sulfur caught on fire, and the  
 16 combustion products included sulfur trioxide and some  
 17 sulfuric acid as well.

18 Q. Where was this?

19 A. This was in Macassar Township, in South Africa.

20 Q. What was your role in that case?

21 A. I was an expert testifying before a presidential  
 22 commission of inquiry with respect to the  
 23 establishment of negligence in that case.

24 Q. What were your other depositions about?

25 A. I have had depositions dealing with a wood waste

1 energy facility located in Flint. I have had  
 2 depositions dealing with a cement facility burning  
 3 hazardous waste in Texas, and I have had depositions  
 4 dealing with a cement facility in Camden, New Jersey.  
 5 Q. Suffice to say, you have pretty good experience with  
 6 depositions. I just want to go over a couple of rules  
 7 to make sure we are on the same page.

8 One, as you know, all of your answers have  
 9 to be oral. A shake of head isn't caught by the court  
 10 reporter, since she is taking everything down.

11 Two, if you need a break at any time, just  
 12 let me know. We are not here for an endurance contest  
 13 or to make you uncomfortable. I just ask if there is  
 14 a question pending, you finish answering the question  
 15 before we break.

16 Third, if I ask anything that doesn't seem  
 17 clear to you or you don't understand, just ask me for  
 18 clarification now so we make sure we are both talking  
 19 about the same thing now as opposed to misinterpreting  
 20 it down the road.

21 Next exhibit I will mark as 1075, I believe  
 22 it's a copy of your resume.

23 MARKED BY THE REPORTER:  
 24 DEPOSITION EXHIBIT NUMBER 1075

25 BY MS. CRABTREE:

1 extensive resume. Can you briefly go over your  
 2 educational history for me on the record?  
 3 A. Sure. I have a BS, bachelor of science, from Rutgers  
 4 University in '79 in the environmental science  
 5 department. MS and Ph.D. degrees from MIT,  
 6 Massachusetts Institute of Technology, in '81 and '86  
 7 respectively. That's the formal education training.  
 8 Q. This appears to be a complete copy of that. I think  
 9 we can probably move on from here. I'm not going to  
 10 drag you through all of it.

11 Tell me how you came to be retained --

12 A. One other --

13 Q. Oh --  
 14 A. -- change on the resume I added here. Currently I'm  
 15 also a professor of civil and environmental  
 16 engineering at the University of Michigan, as well as  
 17 being professor of the environmental sciences.

18 Q. Has that been a recent appointment?

19 A. That appointment initiated January 1 --

20 Q. Congratulations.

21 A. -- 2006.

22 MR. BAILEY: Or condolences. We aren't  
 23 sure.

24 MS. CRABTREE: It's perspective, I guess.

25 BY MS. CRABTREE:

1 Q. If you could take a look at that. I gave you the  
 2 wrong one.

3 MR. BAILEY: The one with your highlights?  
 4 MS. CRABTREE: Yep.  
 5 MR. BAILEY: I would be glad to take that.  
 6 MS. CRABTREE: I don't think there is too  
 7 much interesting on this one.

8 BY MS. CRABTREE:

9 Q. Could you just take a quick look at this and let me  
 10 know?

11 A. It looks like a copy as of October '05.

12 Q. Has anything changed since October of '05?

13 A. Yes.

14 Q. What has?

15 A. There is some new publications and some committee  
 16 assignments.

17 Q. What are those publications about?

18 A. Those publications are dealing, I believe, with  
 19 volatile organic compounds in the environment. I  
 20 believe one of them is an epidemiological paper. And  
 21 I think the others are essentially changes from  
 22 submitted to being accepted, minor stuff like that.

23 Q. Anything relating to sulfur trioxide or sulfuric acid?  
 24 A. No.  
 25 Q. Can you briefly -- this is obviously quite the

1 Q. Can you tell me when you were retained by the Citizens  
 2 Against Pollution?

3 A. I think we had some discussions in the early part of  
 4 2005. I don't have a precise date available, to my  
 5 recollection.

6 Q. Who contacted you?

7 A. I believe it was Jim Hecker.

8 Q. Who all have you had contact with since 2005 in  
 9 relation to this case?

10 A. From the legal staff?

11 Q. Sure.

12 A. Just Jim Hecker and Mr. Bailey here.

13 Q. What about nonlegal staff?

14 A. During a plant visit, I met some of the folks at the  
 15 Gavin facility and also a few other attorneys working  
 16 with Jim Hecker and Mr. Bailey here, and I met Phyllis  
 17 Fox at one of those meetings, and that's all, to my  
 18 recollection right now.

19 Q. Was that the only time you spoke with Dr. Fox?

20 A. No, there was some telephone calls I think that were  
 21 conference calls where she was a participant.

22 Q. Was that during the preparation of your report?

23 A. It was in that time period, yes.

24 Q. Did you review one another's draft expert reports?

25 A. No.

1 Q. What is your understanding of your role in this  
 2 litigation? By this litigation, I mean the Citizens  
 3 Against Pollution versus Ohio Power Company.

4 A. My understanding is that I was to provide an opinion  
 5 regarding the exposure and health effects of the  
 6 sulfuric acid emissions at this facility; that I was  
 7 to examine the likelihood that the Gavin facility was  
 8 the responsible agent or party. Those are the primary  
 9 objectives.

10 Q. When you said the likelihood that the Gavin plant was  
 11 the responsible agent or party, responsible for what?

12 A. Responsible for the concentrations of sulfuric acid  
 13 and the health effects of the local community members.

14 Q. Next I'm going mark 1076. This is the Notice to take  
 15 your deposition today and tomorrow.

16 MARKED BY THE REPORTER:

17 DEPOSITION EXHIBIT NUMBER 1076

18 BY MS. CRABTREE:

19 Q. Have you seen that before?

20 A. Yes.

21 Q. What did you do to prepare for your deposition today?

22 A. What did I do to prepare for it today?

23 Q. To prepare for today's deposition.

24 A. Okay.

25 Q. We are going to give you a chair on the English

1 Q. This is the subpoena. The next document I will show  
 2 you is the subpoena for documents that was served on  
 3 you in December. Actually, it was sent to Mr. Hecker  
 4 on your behalf. Can you take a look at that and tell  
 5 me if you have seen it before?

6 A. Which document do you want me to look at?

7 Q. The subpoena. The other one is the protective order  
 8 that we marked, that had been previously marked.

9 A. Okay. I haven't seen the protective order.

10 Q. I don't think you need to go through it. If you want  
 11 to, you're fine.

12 A. I have no idea what it's about.

13 Q. Okay. I'm not going to ask you any questions about  
 14 it.

15 A. All right. Yes, I have seen this document before.

16 Q. Did you prepare a response to this subpoena?

17 A. Yes.

18 Q. What did you do to prepare that response?

19 A. I made a computer copy of my directory with all of the  
 20 files related to the work product, my expert report.  
 21 I culled my e-mails to find all of those that were  
 22 related to this report, made a copy of that. And for  
 23 materials which were not available electronically, I  
 24 produced a copy, two copies, and I sent them to  
 25 Mr. Hecker.

1 department next.

2 MR. BAILEY: Law school.

3 A. I have done several things. I reviewed expert reports  
 4 that were available to me. "Review" means a fairly  
 5 quick review of them. I reviewed my report and I had  
 6 a telephone discussion with the attorneys with Jim  
 7 Hecker and Mr. Bailey here.

8 BY MS. CRABTREE:

9 Q. About how long did you spend preparing for your  
 10 deposition?

11 A. I haven't calculated the hours, but I have had many  
 12 other things to do this week. So, in total, it's  
 13 probably -- I haven't actually summarized the hours,  
 14 but I will, because you will see that, but  
 15 approximately a day.

16 Q. Okay. Now, how long did it take you to prepare your  
 17 report, your expert report in this case?

18 A. The record will show that I billed for approximately  
 19 124 hours, I believe, on the order of three-some  
 20 weeks.

21 MS. CRABTREE: Next housekeeping business,  
 22 1077.

23 MARKED BY THE REPORTER:

24 DEPOSITION EXHIBIT NUMBER 1077

25 BY MS. CRABTREE:

1 Q. You said you had one file on your computer where you  
 2 kept all of this. Is that typical for you, with a  
 3 project, to keep all of electronic documents in one  
 4 place?

5 A. Yes. Well, no. Actually, I keep them in several  
 6 computers, but they are all maintained, and several  
 7 backups sometimes, but they are all in one directory.

8 Q. I notice --

9 A. At least that's what I try to do.

10 Q. Me too.

11 I notice in your report you mentioned that  
 12 you provided your services at a reduced rate. Why is  
 13 that?

14 A. For cases that I believe are social-justice related  
 15 types of issues for nonprofit organizations, I do  
 16 want, and I feel it's part of my responsibility as an  
 17 academician to provide, to be able to provide services  
 18 to those organizations.

19 Q. How often do you do that?

20 A. At a reduced rate?

21 Q. Yes.

22 A. Routinely for these types of cases.

23 Q. Would you say that you take on more than one project a  
 24 year?

25 A. No, less than one project a year.

1 Q. A project every two or three years?  
 2 A. Probably average something like that.  
 3 Q. Okay. What is your normal rate?  
 4 A. The normal rate is approximately \$300 an hour.  
 5 Q. Did anyone assist you in preparing your report?  
 6 A. I may have had some minor assistance in the form of  
 7 obtaining a article, or something like that, from one  
 8 of my staff, but no one did anything beyond the level  
 9 of clerical assistance or library assistance.  
 10 Q. So nobody provided substantive feedback for you on any  
 11 of your drafts?  
 12 A. No.

13 MARKED BY THE REPORTER:

14 DEPOSITION EXHIBIT NUMBER 1078

15 BY MS. CRABTREE:

16 Q. Exhibit Number 1078 will be a copy of your report, a  
 17 color copy of that. If you can take a look at that  
 18 and tell me if it looks like an accurate copy and  
 19 complete copy.  
 20 A. It does.  
 21 Q. Can you turn -- I would like to turn first to section  
 22 2.2.  
 23 2.1 is a summary of your opinions, and lot  
 24 of those reappear in the substantive sections; is that  
 25 accurate?

1 And, third, the ability to draw some  
 2 inferences from the monitored concentrations is really  
 3 only a function of where they are detected. In other  
 4 words, I can stick a monitor in lots of places and I  
 5 know I won't find a plume touchdown.  
 6 Q. Did you consider the nondetects informative to your  
 7 opinion about exposure in the community?  
 8 A. They are informative only in regard that it provides  
 9 some information with respect to the intensity of the  
 10 monitoring effort.  
 11 Q. What do you mean by the intensity of the monitoring  
 12 effort?  
 13 A. The strategy and the success of the strategy that is  
 14 being used. It's useful to know where and how often a  
 15 monitoring was attempted.  
 16 Q. Did you ever view any protocols for the ambient  
 17 monitoring?  
 18 A. Yes, I have.  
 19 Q. A list of sites where the ambient monitoring was done?  
 20 A. Yes, I have.  
 21 Q. Do you have any opinions about how that ambient  
 22 monitoring was done?  
 23 A. Opinions regarding what?  
 24 Q. Whether it was sufficient, whether it was correctly  
 25 done?

1 A. Yeah. The summary section should be a verbatim copy,  
 2 I think, material that is italicized in other  
 3 sections.  
 4 Q. That's what I thought. If we can go ahead and turn to  
 5 2.2, then. We will start there. This is titled  
 6 Ambient Concentrations of H<sub>2</sub>S04 in the Community. The  
 7 first nonitalicized paragraph in this section, you  
 8 reference Table 1 and say that it lists ambient  
 9 concentrations of H<sub>2</sub>S04 detected in the vicinity of  
 10 the facility in 2001, 2002.

11 Could you flip to Table 1 with me? I have  
 12 a couple of questions on that. Are you there?

13 A. Yes.  
 14 Q. Okay. Now, these are a listing of all the detectable  
 15 concentrations of H<sub>2</sub>S04 from the ambient monitoring;  
 16 is that correct?

17 A. That was the intention of assembling this table, yes.  
 18 Q. Why did you not include the nondetects?  
 19 A. I didn't include the nondetects for a couple of  
 20 reasons. I was interested in understanding where  
 21 plume touchdowns were detected, not necessarily where  
 22 they were not detected.

23 Second, the nondetects, as well as the  
 24 detectives, are listed in other places and are rather  
 25 voluminous.

1 A. What do you mean by correct?  
 2 Q. Well, you said you considered the nondetects  
 3 informative as to how the monitoring was done. Do you  
 4 believe that the monitoring was done effectively?  
 5 A. I don't know what you mean, "effectively." The  
 6 monitoring appears to have been done from the -- I'm  
 7 going to separate the monitoring in a couple of  
 8 components.  
 9 Q. Okay.  
 10 A. The monitoring done by the consultants Lawhon, or  
 11 Lawhon -- I'm not quite sure how to say the name.  
 12 MR. BAILEY: No R, Lawhon.  
 13 A. -- appeared to follow a standard protocol that was  
 14 adequately performed in terms of collecting a  
 15 one-hour, six- or eight-hour average.  
 16 BY MS. CRABTREE:  
 17 Q. What about the 2002 monitoring?  
 18 A. Again, the consultant performing the data sampling  
 19 appeared to collect samples, to the extent of the  
 20 knowledge that I can see, using, again, standardized  
 21 procedure, very simple procedure.  
 22 Q. Would you have done it differently?  
 23 A. Most likely.  
 24 Q. How would you have done it differently?  
 25 A. As I stated in this report, I have not designed a

1 sampling strategy for this case. I think it would be  
 2 done quite differently. The key idea is to recognize  
 3 that plume touchdowns are intermittent and can occur  
 4 over a large spacial area. And it's very difficult to  
 5 capture them with a short grab sample, or a short time  
 6 sample, and thinking about the strategy which would  
 7 provide effective determination of concentrations and  
 8 exposures would probably lead to a design which would  
 9 be a bit different, yes. And I haven't -- as I stated  
 10 in the report, I haven't designed such a strategy for  
 11 this facility.

12 Q. So you don't necessarily have an opinion about the  
 13 better protocol that would be followed; you just think  
 14 you might do it differently?

15 A. I have a number of opinions about better protocols.

16 Q. What are those?

17 A. Well, there are a number of deficiencies in the  
 18 current protocols. And they include inadequate  
 19 temporal and spacial coverage, the difficulties with  
 20 respect to averaging times, detection limit issues.  
 21 And then from the standpoint of understanding sources,  
 22 the simultaneous collection of additional information  
 23 that would help determine both the origin of the  
 24 materials monitored as well as the prevailing  
 25 meteorological, and other conditions that might affect

1 samples, which involve a couple of issues, as I  
 2 discuss in the report. One is the ability to compare  
 3 them to the 2001 data using a longer averaging time.

4 The second has to do with detection limits.  
 5 A third has to do with the likelihood of actually  
 6 capturing a plume touchdown with a short-term sample.

7 Q. Is that difficulty with the averaging time why a lot  
 8 of these values in this Table 1 under duration for the  
 9 2001 area -- or for the 2001 time period, don't have  
 10 anything listed for duration?

11 A. I could not locate duration in the available record to  
 12 me.

13 Q. Now, I notice 10 of the 14 measurements -- I think  
 14 it's 14 measurements, from 2002 were from June of  
 15 2002. Did you find that to be an anomaly from the  
 16 previous year?

17 A. No, there were measurements in 2001 that were detected  
 18 during the June period as well.

19 Q. But the fact that the majority of the 2002 data was in  
 20 the June period didn't strike you as odd?

21 A. Well, I'm aware that there are issues in the 2002 data  
 22 that deal with some background contamination.

23 Q. The two September and one October data points of 2002  
 24 in this chart, we were not able to locate any of that  
 25 data in the sources that you cited for the table. Do

1 concentrations that were monitored.

2 Q. What additional information do you think should be  
 3 included?

4 A. A videoed record is useful, local meteorological  
 5 measurements are useful. Other pollutants can be very  
 6 diagnostic as well.

7 Q. By other pollutants, you mean things like SO<sub>2</sub> and NO<sub>x</sub>?

8 A. SO<sub>2</sub> and NO<sub>x</sub> would be useful.

9 Q. You mentioned difficulties with the averaging times,  
 10 what were those difficulties?

11 A. The protocols, and one thing I neglected to mention in  
 12 terms of deficiencies were the paper record with  
 13 respect to the samples and their analysis, but a  
 14 tighter trail of data completeness and  
 15 characterization would be beneficial and is fairly  
 16 normal in these kinds of incidents.

17 Your question was what?

18 Q. What was the difficulty in averaging time?

19 A. The averaging time, as you are aware, were three to  
 20 eight hours in the 2001 time frame, most being at the  
 21 longer end, roughly six hours. However, the data  
 22 record doesn't explicitly state in all cases what the  
 23 averaging time was, and that's one of the  
 24 difficulties.

25 In 2002 the consultant shifted to one-hour

1 you remember where that information came from?

2 A. I'm sorry, which dates precisely?

3 Q. In 2002, September 11, September 16th, and October  
 4 25th.

5 A. I tried my best to provide the -- what are they  
 6 called, Bates numbers?

7 Q. Uh-huh.

8 A. That's where I believe they came from, and some of  
 9 these spreadsheets are quite large and have multiple  
 10 pages and aren't very well organized or documented,  
 11 and they may have been in there.

12 Q. Okay. It might just be an artifact of us not having  
 13 pinpointed it yet.

14 I'm going to show you a couple of examples  
 15 of the Bates-numbered pages that you have in here to  
 16 make sure I'm clear on what you were looking at. Can  
 17 you grab me AEPGVA 256 to 258. This is just a portion  
 18 of one of the documents that you cited.

19 Thank you.

20 MARKED BY THE REPORTER:

21 DEPOSITION EXHIBIT NUMBER 1079

22 BY MS. CRABTREE:

23 Q. If you can take a look at that. Now, this is a  
 24 portion of one of the documents cited in your notes to  
 25 Table 1. This is the type of data that you relied on

1       in putting together your Table 1?  
 2       A. This is a table that is not a type of data.  
 3       Q. Was this type of information that you relied on in  
 4       putting together your Table 1?  
 5       A. This is some of the data that was available, and  
 6       whether this particular page or not was used, I don't  
 7       know offhand.  
 8       Q. That's fair. There is a lot of pages I'm sure you  
 9       went through.  
 10      A. This is a summary in addition -- the laboratory  
 11     performing the analysis had more details in terms of  
 12     the date and timing analysis that was performed; in  
 13     some cases, the technician performing the analysis,  
 14     and ancillary information like that. I think I might  
 15     have an example of the laboratory sheets.

16            MARKED BY THE REPORTER:

17            DEPOSITION EXHIBIT NUMBER 1080

18    BY MS. CRABTREE:

19    Q. This is AEPGAV 36 through 39. Is this the laboratory  
 20    information you were referring to?  
 21    A. Yes, and there is also -- this is still a summary of  
 22    the information, and there are handwritten entries  
 23    both from the field, I think, as well as from the  
 24    laboratory, I think. I may have attempted to try to  
 25    consolidate all of that information.

1       use a blank correction. And in which case,  
 2       essentially, the blank is subtracted from the  
 3       measurement prior to calculating a concentration.  
 4       This was never clear in terms of the procedure that  
 5       they used or in the data.

6            It's also unfortunate and an inappropriate  
 7       presentation of the data not to flag values that are  
 8       potentially problematic. Typically most laboratories  
 9       will have fields where they indicate a quality measure  
 10      and flag whether or not there is a problem with that.  
 11      Almost every accredited lab will do something like  
 12      that. My lab routinely does that.

13            The periodic reviews of the data and the  
 14       analysis as they come in performed in this case, like  
 15       in most labs on a weekly basis, also didn't generate  
 16       any corrections, flagging -- or flagging of the data  
 17       on a routine basis. So it's difficult to interpret  
 18       how they felt about the analysis.

19            The analysis that was performed, I think,  
 20       characterized the contamination issues as sporadic  
 21       and, thus, applying some likelihood or some  
 22       probabilities the -- most of the samples would be  
 23       unaffected, but that's unclear to me as well.

24            So the analysis of the 2002 data for a  
 25       portion of the time period could have a sample which

1       Q. Those are the handwritten data sheets?  
 2       A. Portions were handwritten in fields.  
 3       Q. You said you were aware of some contamination issues  
 4       with some of the 2002 data. What is your familiarity  
 5       with that?  
 6       A. As can be seen on some of the materials that you have  
 7       handed out, they indicate some of the blanks were  
 8       non -- nonzero; in other words, they had positive  
 9       artifacts on the concentrations of sulfuric acid that  
 10      were apparent on what are either laboratory or field  
 11      blank. It's unclear from the available record.

12            There is also a string of e-mails and short  
 13      reports from -- what's her name -- Bechtle, and an  
 14      analysis, I think performed by her and reviewed by  
 15      Lytle, I think discussing the blank contamination  
 16      issue and the actions to be taken.

17       Q. Did that change your opinion in any way?

18       A. My opinion of what?

19       Q. Of the concentration levels in 2002.

20       A. Well, it makes them more difficult to interpret. You  
 21      have the possibility that the levels here are not  
 22      blank corrected or blank corrected. It was never  
 23      clear to me.

24            The procedure that the laboratory is using,  
 25      I believe one of the documents indicates that they do

1       represents a true value, a true value plus a blank  
 2       contamination issue, a true value with a blank  
 3       correction subtracted, if the laboratory did that, or  
 4       just a blank contamination issue. And I'm in little  
 5       position to judge, as I think we simply don't know.

6       Q. When did you become aware of the problems with  
 7       the -- the potential problems with the 2002 data?

8       A. I had noticed a blank contamination issue when I went  
 9       through the data in the preparation of my report.  
 10      However, at that time I did not provide a systematic  
 11      analysis of blanks, because as I stated, in most  
 12      cases, invalid data would be either flagged or  
 13      otherwise noted.

14            The fuller awareness of the blank  
 15      contamination issue was in discussion with Jim Hecker  
 16      and subsequent review of, I think her name is, Deborah  
 17      Gray's report, expert report. And that was in -- in  
 18      just recent days.

19       Q. Recent days, meaning the past couple of weeks?

20       A. Yeah. It was subsequent to my response to your  
 21      document request.

22       Q. When you noted some of the problems when you were  
 23      going through the data in preparing your expert  
 24      report, why didn't you note in your report that there  
 25      were some potential problems there?

1 A. I didn't provide, as I just stated, a characterization  
 2 of the blanks, and didn't feel at the time, and I had  
 3 seen no other indications at the time, that this was a  
 4 widespread problem, so --

5 Q. Did you --

6 A. Excuse me. I also did not go through the 2001 data  
 7 with the same level. I mean, generally when data are  
 8 provided, you accept the data for what they are, and  
 9 2001 data had no other indication either that there  
 10 was a data quality issue, either good or bad, with  
 11 that data.

12 Q. So you treated --

13 A. Finally, I believe this is an accredited laboratory  
 14 and I do expect that they have a management system in  
 15 place that both corrects problems rapidly as well as  
 16 provides appropriate documentation problems.

17 Q. Anything else?

18 A. That's all I can think of.

19 Q. I don't want to cut you off.

20 So when you were putting together this  
 21 table, you treated the nondetects similarly to the  
 22 blanks and you didn't include them in the table?  
 23 Excuse me, the blanks similarly to the nondetects, and  
 24 you didn't include them in the table?

25 A. I didn't provide any analysis of blanks in this table.

1 number of observations.

2 Did the fact that some of these detectable  
 3 levels occurred on plant property affect your opinion  
 4 about community exposure?

5 A. No, not really.

6 Q. Why?

7 A. First of all, the detections that are available  
 8 represent the situation where the monitoring team is  
 9 able to get to a site in time when the plume may be  
 10 present and, thus, recorded a detectable level. This  
 11 is most likely to be the case where they have access  
 12 to the site, and so -- that, or close to the facility.  
 13 So it's just logistically much easier for the team to  
 14 get out to a site on plant property.

15 Second, a wind shift of a few degrees, a  
 16 gust here or there, may shift the plume to be off-site  
 17 property but, in fact, not have a significantly  
 18 different concentration. And I think that is  
 19 reflected in the totality of the evidence that is  
 20 here, as both with respect to the monitoring as well  
 21 as with respect to the modeling that is performed.

22 Q. Do you know the percentage of 2001 or 2002 samples  
 23 that actually showed detectable levels?

24 A. I did at one point. I'm sure you have it.

25 Q. I don't, actually.

1 As I indicated to you, it's unclear whether we have a  
 2 laboratory blank field blank, and so forth, so I guess  
 3 my fourth reason is that the lack of documentation  
 4 available to me would make an analysis rather  
 5 difficult.

6 Q. Well, let's go head and turn to tables 2 and 3, which  
 7 is the next page in your report. If you can take a  
 8 look at these for me.

9 Table 2, I think this is just a different  
 10 way of asking what I asked you before. At the bottom  
 11 there, you have the number of observations. By that,  
 12 do you mean observations of a detectable level?

13 A. Yes.

14 Q. Okay. That wouldn't include any of the nondetects,  
 15 correct?

16 A. No.

17 Q. Also, if you could flip back to Table 1, many of these  
 18 sampling sites -- I'm looking particularly at the 2001  
 19 data because there seems to be more of it -- a lot of  
 20 these are on plant property, correct?

21 A. Some of them certainly are, yes.

22 Q. Can you tell that for some of them by looking at the  
 23 description?

24 A. Sure.

25 Q. Those are included, though, in your Table 1 as far as

1 A. It's I believe -- it's a percentage in the single  
 2 digits, but I don't recall the exact number.

3 Q. Did that affect your opinions about exposure in the  
 4 community at all?

5 A. Not really.

6 Q. Why?

7 A. As I indicated, the ability to place a monitoring team  
 8 at the appropriate space -- at the appropriate place,  
 9 rather, at the appropriate time over a large region is  
 10 quite poor. And most attempts to try to get at plume  
 11 detections for such episodic events are failures.  
 12 This is nothing secret, nothing unusual. It's been  
 13 shown in additional studies that the ability to do  
 14 this is quite poor.

15 This includes some quite drastic cases  
 16 where, in fact, a team believes they are at the  
 17 correct spot and, in fact, has adverse health impacts  
 18 even at the time. Yet the monitor shows nothing for  
 19 various reasons.

20 So it doesn't surprise me that sort of a  
 21 monitoring strategy using a mobile team, predesignated  
 22 locations, for monitoring with an episodic type of  
 23 event shows, in fact, that there is a very small  
 24 percentage of observations which are what I would  
 25 characterize as hits.

1 Q. You mentioned predetermined locations, did you look at  
2 how those locations were chosen?

3 A. I think I reviewed that. I think I have seen that for  
4 the 2004 data -- 2002 data. For the 2001, I don't  
5 recall offhand.

6 Q. In your table 3 here, on the left-hand side, you have  
7 touchdown duration. Where did these come from?

8 A. This is simply a sequence of durations from a quarter  
9 hour to two hours to demonstrate the point of the  
10 table. So these aren't coming from observations, per  
11 se, from objective observations.

12 Q. Are these what you consider reasonable durations for  
13 plume touchdowns?

14 A. I think this is a reasonable range. Whether or not a  
15 duration is two hours, or whether there is one that is  
16 a quarter hour, I don't know. What I'm trying to  
17 provide here is a reasonable range of durations,  
18 something that we call a sensitivity analysis.

19 Q. What did you base that reasonable range on?

20 A. In part, the frequencies of plume events that I have  
21 seen in other circumstances, frequencies or durations  
22 reported by individuals, video documentation. I tried  
23 to cover a large range here.

24 Q. You mentioned other plume events that you have seen.  
25 What other plume events have you seen?

1 A. I have to think for a second where I got that from.  
2 I believe what I tried to do was look at  
3 recorded durations. Then, since they were incomplete,  
4 I think what I did was to assume certain sampling rate  
5 of -- I forgot exactly. It's in the 50 mills per  
6 minute, or something like that, and then derived it  
7 from the sample of volume which, in fact, was recorded  
8 for the majority of the samples.

9 Q. So you inferred the sampling period then?

10 A. I think that's what I did. I think I also discussed  
11 exactly what I did in the text, and if you will let me  
12 refer back to that?

13 Q. Sure.

14 A. Page 7, the bottom paragraph, on the fifth line, by  
15 examining the monitoring logs sample durations of 11  
16 of the samples were identified as shown in Table 1.  
17 These average 5.7 with the short outlier omitted. The  
18 other sampling durations were -- I'm paraphrasing --  
19 were unavailable. Typically sampling volume over this  
20 period was 96 liters based on the average of 38  
21 samples.

22 And given this average sampling volume, it  
23 would be between three and eight hours based on the  
24 minimum/maximum flows allowable for the NIOSH method.  
25 That's where it was derived from.

1 A. From other facilities not in the Ohio/West Virginia  
2 area, but other emission facilities with tall stacks  
3 emitting sulfur dioxide or other gases that are easy  
4 to measure.

5 Q. What about sulfuric acid?

6 A. No, these didn't include sulfuric acid.

7 Q. Have you ever seen what has been referred to in a lot  
8 of these documents as a blue plume?

9 A. Yes.

10 Q. What were the circumstances of that?

11 A. I made a site visit, as I mentioned, and there was a  
12 tinge of blue, perhaps, in the plume. I have also  
13 seen videographic evidence that I have mentioned.

14 Q. But other than that site visit, you have never seen a  
15 blue plume from either the Gavin or another facility?

16 A. I don't recall seeing or noting other -- I look more  
17 carefully these days.

18 Q. Also, in Table 3 where it says the 2000 sample period  
19 in hours, you have the lowest average and highest. If  
20 you were missing the sampling duration for all of  
21 these samples on the previous page, where did you get  
22 the statistics about the sampling periods?

23 A. Okay. First, I believe you are referring to the 2001  
24 sample period, not the 2000 that you stated.

25 Q. Yes, I'm sorry, 2001.

1 Q. Okay. That's helping me. I think I know the answer  
2 to this, but on Table 3 in these averaging times, you  
3 did not include the durations for the nondetect  
4 samples; is that true?

5 A. For the averaging times for what, I'm sorry?

6 Q. The samples where there was no concentration  
7 detectable.

8 A. For which year?

9 Q. 2001.

10 A. 2001? That's correct. This is based on the detected  
11 data; however, I think I did show, in fact, that the  
12 nondetects at various similar sample volumes, so I  
13 don't expect there to be much of a change.

14 Q. Okay. That was going to be my next question.

15 We can go back to page 6 of your report. I  
16 think I'm done with the charts. The last paragraph on  
17 that page, you reference a document with a Bates  
18 number AEPGAV-E 19844 as saying that both Gavin units  
19 1 and 2 with stated SO<sub>3</sub> stack concentrations, 35 to 40  
20 ppm.

21 I'm going to have you take a look at that  
22 page, what is part of, what looks like a PowerPoint  
23 presentation.

24 MS. CRABTREE: Can you mark that, please.  
25 MARKED BY THE REPORTER:

1 DEPOSITION EXHIBIT NUMBER 1081  
 2 BY MS. CRABTREE:

3 Q. I include the whole presentation for context, October  
 4 2002. It is the last page of this, 19844. It's not  
 5 terribly easy to read.

6 Is this where you got this 35 to 40 ppm per  
 7 stack of SO3 concentration?

8 A. On the last page, it has the number 35 to 40. It's  
 9 cited in the report. So I assume that's where I got  
 10 it from.

11 Q. How did you know this was per stack and not the  
 12 combined stacks?

13 A. I don't know that this provides that information. I  
 14 don't recall right now whether I had looked at some  
 15 additional information to make that determination or  
 16 not.

17 Q. Fair enough. On footnote 2 on page 6, again, this  
 18 time you used a stack concentration of 37 1/2 parts  
 19 per million at both units in 2001. Do you know where  
 20 that assumption came from?

21 A. I think what I did here was assume a range of 35 to 40  
 22 and just take the average of that range, so I used the  
 23 midpoint, and I believe that's where I got 37.5 from  
 24 for 2001.

25 Q. Then you go on to say: 14 parts per million at Gavin

1 piece of information.

2 If I don't have that information, then  
 3 I'm -- I simply don't have that spacial coordinate,  
 4 and that is unfortunate, and I was unable to plot  
 5 those locations on the maps that I provide as figure  
 6 8 -- I think it's actually earlier than that, as  
 7 figures 1A and B -- so I was not able to locate a  
 8 couple of the detected sulfuric acid concentrations,  
 9 so they simply didn't show up on the map.

10 Q. But that doesn't necessarily change your opinions  
 11 about community exposure to the plume?

12 A. No. It would be nice to have more information, of  
 13 course, but the omission of an observation, or two or  
 14 three, doesn't substantially change the picture.

15 Q. Also, in figure 2 -- and you reference this in the  
 16 second nonitalicized paragraph on page 7, figure 2  
 17 shows the wind direction, and you use meteorological  
 18 data from Parkersburg, West Virginia. Did you  
 19 consider using any other source than Parkersburg?

20 A. I think that's a compound question.

21 Q. Did you consider any other meteorological data other  
 22 than Parkersburg?

23 A. Yes.

24 Q. What other sites did you look at?

25 A. I don't recall all of the sites that I looked at. I

1 2 in 2002 and 6 parts per million at unit 1 in 2002.  
 2 Do you know where those numbers came from?

3 A. Off the top of my head, I don't; however, I had seen  
 4 description of emissions at unit 2 and at unit 1 for  
 5 2002 as well, so that's where it was taken from. I  
 6 did not cite the source, which I should have --

7 Q. Okay.

8 A. -- to refresh my memory for that purpose.

9 Q. Would it have been -- would the information you base  
 10 that on be in the documents that you provided in  
 11 response to the subpoena?

12 A. It should be, yes.

13 MS. CRABTREE: Let's take a short break.

14 (A recess was taken)

15 MS. CRABTREE: Back on the record.

16 BY MS. CRABTREE:

17 Q. In section 2.2.1, which starts at the top of page 7,  
 18 you say that several of the site locations for 2001  
 19 are unavailable. This is in the second line of the  
 20 first nonitalicized paragraph. Again, how does not  
 21 knowing the site information for the plume touchdown  
 22 factor in your opinions about community exposure?

23 A. Well, I would like to know as much information as  
 24 possible about the plume touchdowns, and the site  
 25 where the touchdown occurred is, of course, a key

1 looked at the available data from the on-site  
 2 meteorological station at the Gavin facility, as I  
 3 stated in the report, and I believe I also looked at  
 4 several other sites where data were available that I  
 5 could get at on the Ohio EPA website.

6 Q. Did you look at Huntington meteorological data?

7 A. I think Huntington was one that I looked at.

8 Q. What about Pittsburgh?

9 A. I don't believe I spent much time with the Pittsburgh  
 10 data.

11 Q. Now, looking at your figure 2, does this tell us the  
 12 predominant direction that the wind is blowing?

13 A. This is a wind rose that shows us the joint  
 14 probability of wind speed and wind direction over, in  
 15 this case, an 80 -- I think it's an '88 to '92 time  
 16 period. I can't quite read -- in any event, it's a  
 17 multi-year time period which has at least five years  
 18 in it, I think. I don't know if you can read that.

19 Q. I think it is '88 to '92.

20 A. '88 to '92, essentially '88, '89, '90, '91, '92. It's  
 21 typical to assemble these things for five-year time  
 22 periods.

23 This is showing only the winds during the  
 24 April-to-October season, and only from 7:00 a.m. to  
 25 6:00 p.m. season. And this was -- this analysis was

1 provided, as stated there, from an EPA source.

2 Q. I mean, just looking at this and not normally dealing  
3 with these, it looks like there are either more winds  
4 or stronger winds blowing south/southeast than there  
5 are to the north or -- no, south/southwest, than there  
6 are to the north or east. The petals of the rose, if  
7 you will, seem to extend out farther. Is that what  
8 that means, or am I --

9 A. I think you are interpreting that incorrectly.

10 Q. Okay. What does that mean?

11 A. These wind roses show the direction from where the  
12 wind comes.

13 Q. Okay.

14 A. So the wind primarily during this period is coming  
15 from, essentially, the southwest direction and blowing  
16 towards the northeast.

17 Q. That helps me.

18 A. The circles indicate probabilities. If you look  
19 carefully, you can see the innermost circles, 2  
20 percent, and we have 4 percent, and so forth. So, I  
21 think, as I've described in the report, if you just  
22 consider the three longest arm -- or take the four  
23 longest arms; the first -- it's 8, 10, 12, so roughly  
24 40 percent of the time, maybe more, it's blowing from  
25 the general southwest direction.

1 or federal EPA, as well as Ohio EPA, would normally  
2 require that unless site-specific and high-quality  
3 meteorological data on-site is available, in which  
4 case perhaps less data, less -- one-year duration, for  
5 example, could be used.

6 In my review of the data available on-site,  
7 I did not see, first, that the data completeness was  
8 good enough; in other words, there were a lot of  
9 missing data.

10 Second, I didn't have sufficient  
11 information with respect to the location and the  
12 height of the observations. It was not documented on  
13 the materials that I had. And then also I understand  
14 that the site changed, so for those reasons I opted  
15 not to use the on-site meteorological data for this  
16 analysis.

17 However, I did do an analysis comparing  
18 wind directions and wind speeds between the available  
19 data, which, as I stated, was incomplete to provide a  
20 statistically robust wind rose, or other  
21 determination, with the Huntington and perhaps the  
22 Parkersburg data as well. And they showed general  
23 concordance, which I would expect, although the  
24 frequencies of calms and others, low-wind speed  
25 conditions, did diverge somewhat. Again, nothing

1 Q. Okay. You used data from '88 to '92 for this wind  
2 rose, but you used data from the '70s for your  
3 modeling analysis. Why is that?

4 A. It's largely a result of convenience and what is  
5 available.

6 Q. If you had this data to put together this figure,  
7 wouldn't you have had the data to do your modeling?

8 A. There are a number of issues that are fairly technical  
9 in terms of looking at models and looking at wind  
10 roses.

11 First of all, with respect to models, I  
12 think that was also a compound question. The models  
13 typically use data which are believed to be broadly  
14 representative, and a typical procedure is to select  
15 five years of data that we believe are representative.

16 Representative is determined typically by a  
17 meteorologist examining various aspects of the data  
18 but, essentially, believe that there is no atypical  
19 event.

20 Given the randomness and the stochasticity,  
21 randomness, let's just use that, of meteorological  
22 data, generally it's recommended that in a modeling  
23 application you use five years of data that are  
24 believed to be representative. And the general  
25 modeling guidelines from EPA, including national EPA

1 particularly striking in this analysis.

2 Q. When you say you compared the on-site data with the  
3 Huntington data --

4 A. I believe what I did -- I'm sorry, please finish your  
5 question.

6 Q. No. That was my question.

7 A. I don't recall exactly which site I looked at, but I  
8 did do some comparisons where I plotted the wind  
9 direction and the wind speed at the on-site facility  
10 versus one of those sites, just to confirm that it did  
11 have reasonable concordance and that the data were  
12 reasonably reliable, and that analysis produced the  
13 expected result.

14 Q. Now, you say usually data -- you have a meteorologist  
15 look at the data to make sure there are no outlying  
16 events in the data. Did you have a meteorologist look  
17 at this data?

18 A. No. What was done, and what is typically done, is  
19 that the Ohio EPA in this case, the permitting agency,  
20 with the purview over modeling applications, will make  
21 recommendations for the use of meteorological data  
22 with the standard models. And this is what was done  
23 with EPA. It's available and cited in the reports,  
24 available on their website. And I, essentially, used  
25 the recommended data for modeling this facility,

1 taking the data directly off the website appropriate  
 2 for the location of this facility.

3 I, also, as uncertainty analysis or as  
 4 sensitivity analysis, substituted the data for one of  
 5 the other sites nearby to see if it would make any  
 6 difference. And the differences were quite small.  
 7 Which, again, is no surprise. And so the modeling  
 8 results aren't particularly sensitive in this case to  
 9 whether or not you use the Huntington or the  
 10 Parkersburg or, perhaps, other data.

11 Q. But when you ran those other data, you did, in fact,  
 12 choose the model run that gave the highest  
 13 concentration, didn't you?

14 A. No, I don't believe so. What I did was run the  
 15 model -- the model was run -- we are talking about  
 16 modeling here, but your original question was not on  
 17 modeling.

18 Q. Right.

19 A. I just want to remind you.

20 The modeling is done for four or five  
 21 years. And I report the analysis -- the results, the  
 22 highest concentration predicted for each of those  
 23 years.

24 Q. Okay. We will get back into modeling.

25 On the top of page 8, you mention in the

1 appropriate. And since we are looking also at plume  
 2 tracking, this is health effects aside, whether we  
 3 have the plume or not is important to know. Then I  
 4 would like to get quite low.

5 And so the approach used here, essentially,  
 6 workplace-monitoring approach, which is not really  
 7 that sensitive, and I guess if you want me to quantify  
 8 how low I would like to go, I suppose getting 10 times  
 9 below the California REL, on the order of 10  
 10 micrograms, something on that order, 20, would be  
 11 useful.

12 Q. Are you aware of any monitoring methods that would  
 13 allow you to reliably detect 10 micrograms per cubic  
 14 meter, or below, of H<sub>2</sub>SO<sub>4</sub>?

15 A. I haven't researched this recently. There are  
 16 much -- this method, as performed at that application,  
 17 was not optimized and, in fact, their sensitivities  
 18 are at the higher end of things.

19 I believe I have seen labs that are able to  
 20 get well below 1 microgram of background reliably, or  
 21 precisions well below that, which would mean that  
 22 sensitivities at least three times better can be  
 23 achieved using the NIOSH methods.

24 Essentially, any method can be optimized to  
 25 provide greater sensitivity, and this is something

1 ambient monitoring that -- with the 2002 data that  
 2 samples of less than 240 micrograms per cubic meter  
 3 would not be detected. Do you see that as a problem  
 4 with the 2002 ambient monitoring?

5 A. Yes, I answered to you in the affirmative that one of  
 6 problems with monitoring were the detection limits.

7 Q. Why is 240 micrograms per cubic meter limit a problem?

8 A. Well, for a number of the reasons. First, we want to  
 9 be able to detect levels -- well, primarily we want to  
 10 be able to detect lower levels.

11 Second, when you have detection limits  
 12 which are close to the observations, your uncertainty  
 13 is typically higher. So I would like to be able to  
 14 detect materials, pollutants, at lower concentrations  
 15 and with greater certainties.

16 Q. How low concentrations would you want to be able to  
 17 detect?

18 A. For what?

19 Q. H<sub>2</sub>SO<sub>4</sub>.

20 A. In this application or in general?

21 Q. If you were doing ambient monitoring.

22 A. For this application or in general?

23 Q. For this application.

24 A. In this application, I think that getting quite far  
 25 below levels like the California REL would be

1 that we do routinely, not for sulfuric acid, but for  
 2 other contaminants. And there are a variety of  
 3 approaches to optimize this method, the NIOSH 7903.

4 Now, there are other methods that are  
 5 available as well, and their proof of performance in  
 6 the field is not as well characterized as the NIOSH  
 7 method. To become a NIOSH method, you need to undergo  
 8 a battery of tests and validation. These other  
 9 methods are not as well developed, but they certainly  
 10 potentially have good application in -- at the Gavin  
 11 area.

12 Q. Are there other NIOSH methods that would allow you to  
 13 detect ambient H<sub>2</sub>SO<sub>4</sub>?

14 A. Beyond the 7903?

15 Q. Yes.

16 A. I don't recall offhand.

17 Q. When you say "optimize" the process, what do you mean?

18 A. The sampling phase and the analysis phase have many  
 19 parameters. Those parameters can be adjusted to  
 20 improve the sensitivity and this -- I can get into  
 21 details in that, if you would like.

22 Q. But that would be in the collection of the sample, or  
 23 in that -- would that optimization relate to the  
 24 collection of the sample?

25 A. It would, as I just indicated, as well as in the

1 analysis of the sample. And I suppose if we want to  
 2 break it down into the preparation of the media as  
 3 well, which is perhaps the problem that was present in  
 4 some of the 2002 data.

5 Q. What do you mean by the media?

6 A. The absorbant in this case, I believe they obtained  
 7 this from Supelco, comes to the lab or the field  
 8 personnel in glass tubes.

9 They break open the ends and then pass air  
 10 through it. That's the absorbant. I think it's  
 11 silica gel in this case. And that can certainly be  
 12 prepared in a far cleaner fashion at somewhat  
 13 increased cost, relatively small increase in cost.

14 Q. The third paragraph on this page, you mentioned the  
 15 shorter sample period in 2002 further reduced H<sub>2</sub>SO<sub>4</sub>  
 16 plume detections.

17 This is more of a general question: When  
 18 you say "plume detections," do you mean plumes that  
 19 have a measurable amount of H<sub>2</sub>SO<sub>4</sub> in them?

20 A. Not exactly. What is a measurable amount will depend  
 21 on the measurement. So -- I'm sorry, I'm trying to  
 22 find which paragraph here.

23 Q. It's starts out second. It's the third paragraph on  
 24 the page. I'm on page 8.

25 MR. BAILEY: What's the first word in the

1 A. That's my understanding.

2 Q. You had earlier, I believe in footnote 2, referenced a  
 3 14-part-per-million -- it's on page 6, a  
 4 14-part-per-million concentration at Gavin unit 2 in  
 5 2002 with 6 parts per million at unit 1. In Table 1  
 6 you have concentrations ranging up to 2,410 micrograms  
 7 per cubic meter.

8 Is it your opinion that the Gavin plant can  
 9 emit a sufficient amount of sulfuric acid to give a  
 10 2,410-microgram-per-cubic-meter ambient concentration  
 11 with just one SCR running?

12 A. It's a possibility.

13 Q. Now I'm turning to 2.2.3, which is on page 9 of your  
 14 report. This section is entitled AEP is the Dominant  
 15 Source of H<sub>2</sub>SO<sub>4</sub> Emissions in the Cheshire area. It's  
 16 not the only source, though, right?

17 A. No, it's not.

18 Q. You identify four sources under the bullet points in  
 19 this. Are all four of those sources a possible source  
 20 of ambient H<sub>2</sub>SO<sub>4</sub> concentrations in the Cheshire area?

21 A. I think I would characterize them as known sources of  
 22 H<sub>2</sub>SO<sub>4</sub> in the Cheshire area.

23 Q. Did you consider mobile sources, such as cars or  
 24 trucks, along Route 7 as a possible source?

25 A. I considered that.

1 paragraph?

2 BY MS. CRABTREE:

3 Q. The shorter sampling period, 2002, further reduce  
 4 H<sub>2</sub>SO<sub>4</sub> plume detections.

5 A. Okay. And your question is?

6 Q. When -- it's more generally what you mean by a plume  
 7 detection. What do you consider a plume detection?

8 A. When an H<sub>2</sub>SO<sub>4</sub> concentration is detected by the method  
 9 used.

10 Q. There could be a plume without an H<sub>2</sub>SO<sub>4</sub> contingent,  
 11 correct?

12 A. Sure.

13 Q. Is it your understanding that sulfur trioxide or H<sub>2</sub>SO<sub>4</sub>  
 14 changes the behavior of a plume?

15 A. Not in any significant amount, I would say.

16 Q. Does it change the chemistry of the plume, other than  
 17 by virtue of being there?

18 A. Sure. It's an acidic aerosol and it will have a  
 19 degree of chemistry that is taking place. Whether  
 20 it's significant at these time scales seems somewhat  
 21 doubtful, but there is plume chemistry going on.

22 Q. Okay. The last paragraph on this page -- I'm sorry,  
 23 that's not right.

24 Is it your understanding that just one SCR  
 25 was operating in 2002?

1 Q. Did you quantify that anywhere?

2 A. No, I didn't.

3 Q. Now I'm looking at section 2.2.4, which is entitled  
 4 Meteorology During Plume Detections Indicates that  
 5 Gavin is the Major Source of H<sub>2</sub>SO<sub>4</sub>. In that, you  
 6 reference -- in that section, you reference Table 4,  
 7 and that table is referenced in the second paragraph  
 8 on page 10.

9 My first question on Table 4, why are there  
 10 only 12 days listed here, but there are 38 days listed  
 11 in Table 1?

12 A. I provided this analysis for a subset of the data.

13 Q. How did you determine what that subset would be?

14 A. I believe I selected the 2002 data and then I  
 15 selected, I believe, the higher 2001 data.

16 Q. So, in general, you chose the highest values for this  
 17 chart, then?

18 A. No. I said, for 2002 I selected, I believe, all of  
 19 the data; and for 2001, I believe, I selected the  
 20 higher data points.

21 In the second paragraph on page 10, first  
 22 line, I state, I provide all 2002 data and selected  
 23 2001, as I have just indicated to you.

24 Q. I was just wondering how you selected those two  
 25 particular dates from 2001.

1 A. I think I selected the higher concentrations. Then I  
2 simply ran out of time to provide this analysis.  
3  
4 Also, the results were fairly consistent with what I  
5 had looked at, so I stopped at that point.  
6  
7 Q. This is a day-by-day comparison, not necessarily a  
8 concentration-by-concentration? I notice in Table 1  
9 there are some days where there are multiple  
10 concentrations detected.  
11  
12 A. That's correct.  
13  
14 Q. So when you have prevailing meteorology in Table 4,  
15 you are looking at the entire day?  
16  
17 A. I did my best to try to understand when the sample was  
18 collected and the meteorology that prevailed during  
19 the sampling collection. However, because of  
20 inadequate documentation in the sampling, that could  
21 not always be done. And then I noted that I believe  
22 the consultant was sampling during the daytime up to  
23 midnight hours, or something like that, but I believe  
24 was unlikely to be sampling in, say, the early morning  
25 from midnight onward. I did look at that data.  
As it states on page 9, the last paragraph

1 same type of quantitative analysis for any of the  
2 other identified sources of sulfuric acid in the area?  
3  
4 Q. Did I do the same analysis as on page 10? I'm still  
5 uncertain what you are asking exactly.  
6  
7 Q. Let's start with that. Did you do the same analysis  
8 as on page 10 with the other facilities?  
9  
10 A. I have to step further back. What do you mean by the  
11 same? Same as what?  
12  
13 Q. Same as the analysis as you did on page 10 between  
14 Gavin and Kyger Creek?  
15  
16 A. Again, I'm sorry to be so specific. Are you talking  
17 about the analysis that is in one, two -- the fifth  
18 paragraph?  
19  
20 Q. In contrast to Gavin, the Kyger Creek facility has a  
21 taller stack --  
22  
23 A. Okay. No, I don't recall doing -- I don't believe I  
24 did any other analysis similar to this, other than the  
25 Kyger Creek facility and Gavin facility.  
Do you know the megawatt reading for the Kyger Creek  
facility?  
I did.  
It's a memory test.  
I don't recall it offhand.  
Do you know how many units are there?  
It has a single stack, I believe, and I don't recall

1 above the footnotes: This analysis was based on  
2 surface meteorological data from the on-site station  
3 at Gavin as well as the Parkersburg.  
4  
5 Q. The PKB is Parkersburg?  
6  
7 A. That's correct.  
8  
9 Q. All right. Did you look at the Parkersburg or Gavin  
10 data to identify periods of calm or light winds where  
11 there wasn't an ambient concentration detected?  
12  
13 A. Yes. I did an analysis of the frequency of calms, and  
14 I didn't make a determination in that analysis whether  
15 or not there were detections.  
16  
17 Q. So those were separate analyses, then?  
18  
19 A. Largely separate analyses, not entirely separate  
20 because I do believe I plotted data over this period  
21 and looked at a fair amount of data, whether or not  
22 there was detections or not.  
23  
24 Q. You conducted -- in this section of your report, you  
25 conduct a quantitative comparison of Kyger Creek  
emissions with Gavin emissions. Did you do any type  
of quantitative analysis for these other sources of  
sulfuric acid in the ambient air?  
I'm a little uncertain what you mean by quantitative  
comparison.  
You went through and did some calculations comparing  
Gavin and Kyger Creek on page 10. Did you do that

1 for certain how many units are there.  
2  
3 Q. Are you familiar with the term "atmospheric  
4 stability"?

5 A. Yes.  
6  
7 Q. What effect does -- first, can you define the term for  
8 me?  
9  
10 A. Yes.  
11  
12 Q. Please do.  
13  
14 A. Atmospheric stability refers to the tendency of the  
15 atmosphere to provide dispersion or mixing.  
16  
17 Q. Would a more stable atmosphere produce more mixing?  
18  
19 A. In general, no. An unstable atmosphere produces more  
mixing.  
20  
21 Q. What effect does atmospheric stability have on the  
22 plume, the Gavin plumes?  
23  
24 A. Atmosphere stability would affect the degree of mixing  
25 of the plume and the dilution that results and,  
ultimately, is one of the factors that would influence  
the ground level concentrations.  
It would be one of the factors?  
Sure.  
Which would have a greater impact, wind speed or  
atmospheric stability?  
There are a couple of parameters, so that question  
doesn't make a lot of sense.

1 Q. Okay. What are those parameters?  
 2 A. Atmospheric stability is determined in part by wind  
 3 speed. So when wind speeds are very high, you are  
 4 unlikely to have stable atmospheres.  
 5 Q. So you are going to have a more stable atmosphere when  
 6 the wind speeds are low?  
 7 A. Not necessarily, but you can.  
 8 Q. Would there be more of a tendency to have a more  
 9 stable atmosphere when the winds were low?  
 10 A. It's not the way I would like to approach the  
 11 question. I mean, the stabilities are a result of a  
 12 number of factors, which include wind speed. And  
 13 under certain wind-speed conditions, you can have  
 14 certain stabilities.  
 15 Q. What are the other factors in atmospheric stability?  
 16 A. The other factors that determine atmosphere stability,  
 17 is that what you are suggesting?  
 18 Q. Yes.  
 19 A. If you use, for example, the models that are  
 20 represented in my report here, atmospheric stability  
 21 is a classification system based on the sun angle or  
 22 the time of the day, and the season. The insulation  
 23 and the wind speed using a system that EPA has  
 24 codified, I suppose, in their conventional Gaussian,  
 25 G-U-A-S-S-I-A-N, plume models. But there are

1 during the process of running that model anywhere?  
 2 A. No, I don't think I considered quantifying it. We use  
 3 an input file which has the atmospheric stability  
 4 typing system determined for us, but we don't quantify  
 5 it, per se.  
 6 Q. Did you look at what the atmospheric stability was  
 7 during the plume -- the plume touchdown -- wait, I'm  
 8 starting over.  
 9 Did you look at what the atmospheric  
 10 stability was at the time of the observations in your  
 11 Table 1? It's the listing of the concentrations.  
 12 A. For some of them, I think I did, yes.  
 13 Q. What did you find?  
 14 A. Well, first of all, Table 4 has the analysis of the  
 15 ground-level concentrations and prevailing  
 16 meteorological conditions. And I can look at that,  
 17 and infer from the light winds the time of the day,  
 18 the high sun angle, the lack of precipitation, and so  
 19 forth, at most likely that we were in unstable  
 20 conditions for most of those events.  
 21 I believe I looked at available  
 22 meteorological data for this, and I can look at the  
 23 data and indicate whether or not we are likely to be  
 24 in unstable, neutral, or stable conditions.  
 25 Q. It just wasn't an explicit analysis that you provided?

1 alternative typing systems for stability.  
 2 Q. When you run the modeling, the type of modeling that  
 3 you ran, which I understand is the ISC model?  
 4 A. There were two models that were run in -- well,  
 5 actually more, but the ISC is one of the models, yes.  
 6 Q. The Screen 3 was the other mentioned in the report?  
 7 A. The other Gaussian plume dispersion model, that's  
 8 correct.  
 9 Q. You said there were more than two?  
 10 A. Yeah, I would consider some of the analyses that I  
 11 provided later on as modeling types of things, but for  
 12 your purpose, I think these are the ones you're  
 13 referring to.  
 14 Q. What other analyses would you consider as modeling?  
 15 A. Well, I take a model as quite broadly defined. So a  
 16 model, for example, that we have already talked about  
 17 is represented in the attenuation factors. This is a  
 18 type of model.

19 The -- the examples that I provide later  
 20 on, looking at dilution factors, is a type of  
 21 model. This is the sort of things I'm talking about.

22 Q. I think I understand now.

23 When you run the Screen 3 -- or the ISC  
 24 model. Let's start with the ISC model. When you run  
 25 the ISC model, do you quantify atmospheric stability

1 A. No, it wasn't explicit.  
 2 Q. Going back a minute. In the paragraph we were talking  
 3 about where you were comparing Gavin and Kyger Creek,  
 4 on page 10, about two-thirds of the way down, you say:  
 5 Screen 3 predicts that Kyger Creek's worst-case impact  
 6 would be a factor of 2.26 times lower than Gavin, a  
 7 difference entirely attributable to the additional  
 8 plume height obtained at Kyger Creek.  
 9 If Kyger Creek was a scrubbed plant, would  
 10 that change your analysis?  
 11 A. If you change parameters of the release, then implicit  
 12 in your question is that scrubbing would change  
 13 parameters of the release then, yes, the analysis  
 14 would change.  
 15 Q. Okay. Because you had said "a difference entirely  
 16 attributable to the additional plume height." By  
 17 plume height, do mean the actual plume or the stack?  
 18 A. Oh, I see your confusion, sorry.  
 19 The plume height is the combination of the  
 20 physical stack height. And, as you know, the Kyger  
 21 Creek stack is taller, and then the plume rise, which  
 22 is the additional height attained as a result of  
 23 temperature or buoyancy effects and momentum effects  
 24 coming from the velocity of the plume. This is  
 25 referring to the change in plume height, which is the

1       sum of those two.

2   Q.    Okay. That's what I didn't understand.

3            This gets back to a question I think I  
4       asked earlier but I didn't quite get the answer to.  
5       I'm on page 11. It's the first nonitalicized  
6       paragraph, the third line down: I selected the five  
7       years of PKB data, 1973 to '77, as the longest and  
8       most representative meteorological record available  
9       for analysis.

10          Why did you not use the '88 to '92  
11       meteorological data that you used for one of your  
12       figures?

13   A.    Yeah, as I recall that figure, to be specific, that  
14       was the wind rose which was shown as figure 2, was  
15       provided directly from EPA. And I just grabbed that.  
16       I don't know for sure that the '88 to '92  
17       meteorological data that that is based on, was  
18       available conveniently. That's the primary reason.

19            Both of these data sets are believed to be,  
20       you know, reasonably representative, so probably won't  
21       make a large difference one way or the other.

22   Q.    What did you do to compare the climatology in the  
23       mid-'70s to the current conditions?

24   A.    I looked at some of the distribution data and,  
25       perhaps, some other analyses. I don't recall.

1       A.    It would be a very light wind.

2   Q.    Here you say that July would have the most calms  
3       during the ozone season?

4   A.    Is that a question?

5   Q.    Yes.

6   A.    Well, I stated in looking at this record of data, in  
7       July there were 25 days of calms -- with calms,  
8       rather.

9   Q.    In the bullet point before that, the last sentence of  
10       that says: The frequency of the calms is the highest  
11       in July with 122 hours, 16.4 percent of hours in the  
12       month.

13   A.    Yeah. It's slightly higher in July. It's -- as I  
14       stated there, it's 12 percent on an annual basis. And  
15       July is, as I say in the last paragraph, the last  
16       bullet sentence in that paragraph, it's 16 percent,  
17       16.4 percent in July.

18   Q.    So if the calms are most prevalent in July, does it  
19       surprise you that only one measurement from 2002 of a  
20       detectable amount was from July?

21   A.    No, not necessarily, because there are other things  
22       that are involved as well. And plume detections, as I  
23       indicated to you first, there were systematic problems  
24       with respect to the ability to detect the plume, given  
25       the monitoring strategy that was selected.

1   Q.    Did you look at other sources to try to get more  
2       contemporary meteorological data than the Parkersburg  
3       '73 to '77 data?

4   A.    Yes. I had the on-site data, which I compared  
5       to -- you can refresh my memory now -- with the  
6       Parkersburg data, and that is contemporary with this  
7       time period.

8   Q.    With the '73 to '77 time period?

9   A.    No, no, the on-site data is less five years.

10   Q.    Okay. So you compared the '73 to '77 to the more  
11       current on-site data which you said before wasn't  
12       complete enough to use in this analysis?

13   A.    That's correct. I did some basic distribution  
14       statistics.

15   Q.    In your bullet points now, on the second bullet point,  
16       you identified July as the month where there would be  
17       the most calms. First, can you define calms for me?

18   A.    Sure. Calms are simply defined as a period of time  
19       where the wind speed is not high enough to,  
20       essentially, to make the manometer revolve. So there  
21       is no determination of what the wind speed is.  
22       Typically, the wind speed is below a meter or meter  
23       and half per second.

24   Q.    So there could be a very, very light wind that's not  
25       just being picked up?

1       Second, this is a random process, so the  
2       difference between 16 percent in July and, perhaps, 14  
3       or 15, or whatever, percent it is in June when you  
4       have relatively small sample size, isn't likely to be  
5       detected.

6            This analysis also doesn't take account of  
7       winds shifts and wind directions and operations at the  
8       facility, and so forth. So you are looking at only 1  
9       parameter here, and it's not surprising, given the  
10       randomness here and the sampling strategy and the  
11       problems that are present, that you found more  
12       detections in one month than another.

13   Q.    If the SCRs were operated year-round, would you expect  
14       to find more ambient concentrations detected in the  
15       ozone season than in the nonozone season?

16   A.    You have to clarify a few things for me.

17   Q.    Okay.

18   A.    First of all, the SCRs, if they were operated  
19       year-round, the facility could still have levels of  
20       emissions of SO3 and H2SO4 that might vary seasonally,  
21       and I don't know what that variation would be,  
22       premised on your question to me.

23   Q.    I'm assuming the concentrations from the stack were  
24       the same year-round.

25   A.    Okay. Assuming the emission rate was the same

1 year-round, which would be the same as what you just  
 2 stated, except that in addition to concentrations we  
 3 would have the same output of a plant, which is  
 4 likely, as it's a base-loaded facility.

5 Next, then, the meteorological conditions  
 6 during the nonozone season vary, clearly. We have  
 7 wind profiles, wind rose profiles, for example, that  
 8 will be quite different from what we saw in figure 2.  
 9 We have wind speeds which are also quite different  
 10 from what we see in figure 2.

11 So I, offhand, have not run that analysis  
 12 to see whether or not, for example, a dispersion model  
 13 would predict a higher concentration in one season or  
 14 another. I really haven't focused on that.

15 However, your question, in fact, was more  
 16 limited because you were talking about plume  
 17 detections. And there was, essentially, very limited  
 18 monitoring outside the ozone season. So, without the  
 19 monitoring, you wouldn't have any plume detections.

20 Q. Okay.

21 A. I take it that my answer would really be contingent on  
 22 an ability to detect a plume detection.

23 Q. Assuming that you have same ability year-round?

24 A. Ability to?

25 Q. To detect concentrations year-round, can you opine as

1 that, and there is always the chance that you will  
 2 have an unusual condition in September, something like  
 3 that, that might produce a high concentration.

4 Q. Do you believe there will be a plume touchdown every  
 5 time there is a calm?

6 A. I would say that is unlikely.

7 Q. What percentage during the ozone season would you  
 8 expect there to be a plume touchdown when there is a  
 9 calm?

10 A. I don't have the information to provide that answer.

11 Q. Is it your opinion that any detect -- any plume  
 12 touchdown is a health hazard?

13 A. Plume touchdown definition is kind of vague to me. If  
 14 you can be a little more precise on that, because we  
 15 have been using plume touchdown to mean a number of  
 16 different things here.

17 Q. What do you consider to be a plume touchdown?

18 A. I think a plume touchdown is an event which causes a  
 19 high ground-level concentration in the vicinity of the  
 20 facility extending to some distance. And,  
 21 technically, I'm a little uncomfortable with touchdown  
 22 because normal dispersion of the plume would lead to  
 23 patches or plume borders or boundaries or tails of the  
 24 plume impinging on the earth surface, or near the  
 25 earth surface, while much of the plume is still far

1 to whether there would be more or less detectable  
 2 plumes in the ozone season without running that more  
 3 detailed analysis?

4 A. You said "year-round" and then you said "in the ozone  
 5 season."

6 MS. CRABTREE: Can you repeat to me that  
 7 back?

8 (The requested portion of the record was  
 9 read by the reporter)

10 BY MS. CRABTREE:

11 Q. I will ask it better. If you had the same ability to  
 12 detect the plume year-round, would you, in general,  
 13 expect more plume touchdowns in the ozone season, all  
 14 other things being equal?

15 A. Yeah, I think I would, with plume touchdowns defined  
 16 as occurring in the local vicinity. And the reason  
 17 for that is that the stability conditions, to come  
 18 back to that, during the rest of the year when the  
 19 wind speeds are higher, when the insulation is lower,  
 20 i.e., it's not summer, so the sun is not overhead, and  
 21 the likelihood of inversion conditions also is going  
 22 to be different as well, would probably lead to  
 23 greater dispersion of the plume and, thus, lower  
 24 ground-level concentrations.

25 But I haven't run that analysis to confirm

1 overhead. So you can, in fact, produce ground-level  
 2 concentrations that are measurable even though much of  
 3 the plume is still well above. And, you know, the  
 4 common vernacular, you sort of think of a plume as a  
 5 liquid stream, or something like that, just pouring  
 6 down to the ground.

7 Well, in this case a few droplets, if you  
 8 would like to use that analogy, have dispersed down to  
 9 the ground. Whether that is a plume touchdown event  
 10 or not, I'm not hung up on the semantics.

11 From the health-science perspective, I care  
 12 about what is the ground-level concentration, whether  
 13 or not you call it a plume touchdown.

14 Q. Okay. Let's call it a high ground-level  
 15 concentration. How high a ground-level concentration  
 16 would you consider a health hazard?

17 A. In the report, I go through a number of different  
 18 concentration ranges that might be considered as  
 19 benchmark values, if you will, or guideline values,  
 20 and something on the order of 100 micrograms per cubic  
 21 meter is, say, a level of concern, something on that  
 22 range. I'm sure we will talk a lot more about that.

23 Q. We will get there.

24 A. For the purpose of just moving our discussion here,  
 25 I'm just going to provide that number. I don't want

1 to be pinned to that particular number at this point,  
 2 but just to move things along.

3 Q. In your opinion, is any ground-level concentration of  
 4 100 micrograms per cubic meter or above a cause for  
 5 concern?

6 A. It could be, yes.

7 Q. Under what circumstances could it be?

8 A. Well, if there is an exposure that's occurring, it  
 9 would be of concern.

10 Q. But if there was no one there, it wouldn't be of  
 11 concern?

12 A. If there is no one there, it would not be a health  
 13 concern.

14 Q. A tree falling in a forest?

15 A. To humans.

16 MR. BAILEY: You have to define no one.

17 MS. CRABTREE: No humans.

18 BY MS. CRABTREE:

19 Q. Do you have any understanding of the future operating  
 20 plans at the Gavin facility?

21 A. Yes.

22 Q. What's your understanding?

23 A. My understanding is that the facility will continue to  
 24 operate; that they are changing out the catalyst in  
 25 the spring, I think, of this year in one of the units;

1 (A recess was taken)

2 MS. CRABTREE: Back on the record.

3 BY MR. CRABTREE:

4 Q. I want to move now toward the dispersion modeling  
 5 section of your report, section 2.3. How often do you  
 6 engage in modeling of this sort. By this sort, I mean  
 7 dispersion modeling.

8 A. Frequently.

9 Q. How frequently?

10 A. I have probably modeled hundreds of facilities in  
 11 applications over the years.

12 Q. Do you run the models yourself?

13 A. Not necessarily.

14 Q. Do you usually run the modeling yourself?

15 A. Sometimes I run the model myself; sometimes I have  
 16 students run it.

17 Q. Did you run this model yourself?

18 A. I believe I ran this one myself.

19 Q. When you do dispersion modeling, do you usually run  
 20 the ISC model?

21 A. Often; not exclusively.

22 Q. What other models, dispersion models, do you use?

23 A. ISC is being phased out in a bit, so we are using Air  
 24 Mod now.

25 Q. That was November of last year that Air Mod was

1 and other than that, it's business as usual, I  
 2 believe.

3 Q. What about year-round operation of the SCRs, do you  
 4 have any knowledge/understanding of whether that will  
 5 happen?

6 A. I haven't seen anything specific that would -- on that  
 7 matter. My understanding is that the SCRs will  
 8 operate during the ozone season, and it's -- I have no  
 9 specific information with respect to Ohio EPA's policy  
 10 on that.

11 Q. Okay. Why would that implicate Ohio's EPA policy?

12 A. My understanding is that it states monitoring ozone  
 13 during the ozone season and are, in fact, somewhat  
 14 reluctant to extend monitoring into the nonozone  
 15 season.

16 It's the state's monitoring that determines  
 17 compliance or noncompliance with the national ambient  
 18 air quality standards. States are not particularly  
 19 eager to increase their costs of monitoring and, in  
 20 particular, have the possibility discovering they are  
 21 not in compliance during the nonozone season.

22 MS. CRABTREE: I'm at a good stopping point  
 23 before we jump in dispersion modeling, if we want to  
 24 take a quick break.

25 MR. BAILEY: Sure.

1 approved by EPA or added --

2 A. No, it's been out there for a little while, but in  
 3 terms of being an approved or recommended guideline  
 4 model, I don't know the exact date when the EPA has  
 5 made that recommendation.

6 Q. What time period did you conduct your ISC modeling?

7 A. In the fall last year. I don't recall the exact date.

8 Q. Other than the ISC model and Air Mod, do you use any  
 9 other dispersion models?

10 A. Yes, there are a variety of different models. I mean,  
 11 Caline is another model, for example, C-A-L-I-N-E.

12 Q. Why didn't you run Air Mod on the Gavin data for this  
 13 case?

14 A. First of all, I was just interested in replicating the  
 15 analysis that was performed for Gavin and approved by  
 16 Ohio EPA.

17 Second, I had the input files, or very  
 18 close facsimile to the input files, making the  
 19 application quite easy to run.

20 And, third, it's a fair amount of work to  
 21 port it over to another model, and resources weren't  
 22 available to me to do that.

23 Q. Do you have any sense of whether your results would  
 24 have been different if you had used Air Mod?

25 A. Yeah, they probably would differ some. I haven't run

1 the Air Mod in this application, so I didn't know  
 2 offhand how much they would differ.

3 Q. Do you know if they would tend to predict higher or  
 4 lower concentrations?

5 A. I don't know that offhand. I haven't run the model,  
 6 as I stated.

7 Q. You said you had the input files for the ISC models.  
 8 Were did you get those from?

9 A. That was on some of the electronic files that were  
 10 obtained in discovery.

11 Q. So they came from the defendant?

12 A. Well, they came via Jim Hecker, wherever he got them  
 13 from.

14 Q. I think I know where they came from then.

15 The first nonitalicized paragraph, 2.3,  
 16 page 12, you say that you used a stack gas  
 17 concentration for SO<sub>3</sub>/H<sub>2</sub>SO<sub>4</sub> of 17.5 ppm. That's parts  
 18 per million, right?

19 A. That's correct.

20 Q. Why did you use 17.5?

21 A. I think what I tried to do is to essentially replicate  
 22 the modeling that was performed by Ohio EPA, and as  
 23 stated in the same paragraph that you just quoted, I  
 24 believe that provided the emission rate of  
 25 approximately 122 grams per second at each stack.

1 to work with and compile some of the statistics.

2 Third, I'm interested in providing some  
 3 degree of sensitivity analysis to see, as we discussed  
 4 earlier, what would be the impact of changing from  
 5 Parkersburg to another meteorological database to see,  
 6 in fact, if results are abnormally sensitive to an  
 7 input. I think those are the major reasons.

8 Q. Okay. You note on the last paragraph on this page:  
 9 The highest one-hour H<sub>2</sub>SO<sub>4</sub> concentrations over the  
 10 four-year period range from 109 to 130 micrograms per  
 11 cubic meter.

12 You mentioned earlier that usually you use  
 13 five years of meteorological data. Why did you only  
 14 use four years here?

15 A. Yeah. I think what happened was for a period of time  
 16 I could not locate the fifth year of data. That's why  
 17 that was not run. I think subsequently I may have  
 18 located that data, and it doesn't change the results  
 19 in any substantial way, but I think that's what  
 20 happened in that case.

21 Q. You say: The highest one-hour concentrations range  
 22 from 109 to 130 micrograms per cubic meter.

23 Does that mean 130 micrograms per cubic  
 24 meter would be the maximum expected ground-level  
 25 concentration over a one-hour period?

1 When you convert that to a ppm concentration, you get  
 2 approximate 17.5.

3 Q. You said that you tried to replicate the model, did  
 4 you ever see the output files from that modeling?

5 (Discussion off the record)

6 BY MS. CRABTREE:

7 Q. Go ahead.

8 A. The question was did I ever see the output files. I  
 9 saw output files of dispersion modeling runs provided  
 10 by Jim Hecker. I don't recall offhand whether those  
 11 were run by Ohio EPA or by the Ohio Power, but they  
 12 were outputs that I did see.

13 Q. Did you compare your outputs to the output files that  
 14 you had?

15 A. These files were very large. I compared part of them,  
 16 anyway, to what I had.

17 Q. Did they generally match those other output files?

18 A. I think they did.

19 Q. Why didn't you just use the output files that you had?

20 A. Well, first, I'm interested in replicating the data to  
 21 provide some degree of assurance that things are okay.  
 22 Second, I'm also interested in working with  
 23 the data a little bit, and the output files that were  
 24 provided are in a -- I'm not sure if they were in a  
 25 PDF format, or whatever, but it wasn't very convenient

1 A. That is the maximum predicted one-hour concentration  
 2 over that simulation period of four years.

3 Q. Going back to your Table 1, the second to last column,  
 4 it looks like all of the concentrations in micrograms  
 5 per cubic meter for the 2002 data are well over the  
 6 130 micrograms per cubic meter, but they all tend to  
 7 have close to a one-hour duration. Did that cause you  
 8 concern as far as the validity of your modeling  
 9 outputs?

10 A. No.

11 Q. Did it cause you concern as to the validity of the  
 12 2002 data?

13 A. The monitoring data?

14 Q. Yes.

15 A. Not directly, no.

16 Q. Why?

17 A. As I explained at some length in the report on pages  
 18 13, I think, and 14, and on page -- well, extensively  
 19 limited -- largely limited to those two pages, there  
 20 are a number of limitations in the dispersion modeling  
 21 that can cause the predicted concentrations to  
 22 underpredict the concentrations that occur in the  
 23 vicinity of the Gavin facility.

24 Q. Now, can you turn to Table 5 for me, please, in the  
 25 back of your report. This table is labeled predicted

1 highest and second highest one-hour and 24-hour H<sub>2</sub>SO<sub>4</sub>  
 2 concentrations from 1974 to '7 disperse modeling.

3 What I didn't understand was under the  
 4 concentration column, it says micrograms per cubic  
 5 meter. At the bottom, you have an average of 10.4 and  
 6 6.6. What do those numbers mean?

7 A. Okay. If you look under the entry one-hour  
 8 concentrations --

9 Q. Uh-huh.

10 A. -- then we have the first and second high for the four  
 11 years, so there should be eight rows of data there.

12 Q. Yes.

13 A. Then there is an average 1 and 2, so that represents  
 14 the average high and the average second high for the  
 15 one-hour data.

16 The next eight lines are the 24-hour data,  
 17 and following that we have the average 1 and 2, and  
 18 that's the average highest and second highest  
 19 24-hour concentration.

20 Q. So your average 1 is an average of all of the ones  
 21 labeled 1 in the lines above?

22 A. That's correct.

23 Q. Okay. I just wanted be clear --

24 A. For only that subset. Maybe a line between the  
 25 1-hour and the 24-hour parts would help you.

1 This actually goes back up to the paragraph  
 2 above, 2.3, you say: 2004 TRI data shows a large  
 3 increase in emissions over 2002.

4 Do you know if one or both SCRs were  
 5 operating in 2003?

6 A. I think footnote 8 states that both units had  
 7 operating SCRs in 2004 and only one operating SCR in  
 8 years 2002 and 2003. I think that's correct.

9 Q. You assumed just one SCR in 2003?

10 A. That's correct.

11 Q. Okay.

12 A. But I don't have any data from 2003 anyway, other than  
 13 the TRI data. So it's kind of irrelevant to the  
 14 answer.

15 Q. If you have calm surface winds at ground level, does

16 that mean you will have calm winds at stack height?

17 A. We talk about calms as winds that are not measurable  
 18 at the height of the instrumentation. And certainly  
 19 you can have different conditions prevailing aloft.

20 But we don't talk about calm surface winds because  
 21 calms are a no-win condition and winds are a windy  
 22 condition, so it's kind of an oxymoron.

23 Q. Would winds tend to be heavier at plume height versus  
 24 ground level? Or "higher" is probably the better  
 25 word.

1 Q. I just drew one.

2 A. Okay.

3 Q. So the average concentration -- one-hour concentration  
 4 at the parameters that you modeled would be 121.1  
 5 micrograms per cubic meter?

6 A. That's the average of the four highest, the  
 7 annual -- the annual maximum.

8 Q. And the average of the 24-hour concentrations, the  
 9 highest ones, was 10.4 micrograms per cubic meter; is  
 10 that correct?

11 A. That's correct.

12 Q. Why is the 24-hour concentration so much lower than  
 13 the 1-hour concentration?

14 A. The answer is because the wind is unlikely to be in  
 15 the same direction for all 24 hours of the day, and  
 16 the other factors that affect dispersion are  
 17 completely unlikely to be the same and, thus, you have  
 18 basically the plume going in all different directions  
 19 over a 24-hour period, but the average 24-hour  
 20 concentrations is taken only at one location. So you  
 21 are essentially just not following the plume. You are  
 22 at just one location.

23 Q. All right. Going back to your text, a question about  
 24 footnote 8, on page 12, just to go back for a moment.  
 25 Footnote 8 -- hold on one second.

1 A. The velocity of the wind is normally higher as you go  
 2 up, or at least not lower, due to diminished coupling,  
 3 but it's certainly possible to have calms aloft as  
 4 well.

5 Q. On page 14, at the very top there is a bullet point  
 6 there, and actually preceding text to that, there is a  
 7 bullet point before that on page 13, and you are  
 8 talking -- this is in a section called dispersion  
 9 modeling has major limitations. There you say: The  
 10 periods of less than one area -- excuse me.

11 Periods of less than one hour are not  
 12 modeled; thus, precluding comparison with short-term  
 13 occupational standards and guidelines.

14 Do you see where I'm at?

15 A. Page 14?

16 Q. Yes.

17 A. Yes.

18 Q. But later in your report, you had recommended -- on  
 19 page 21 of your report, the second bullet point under  
 20 2.6.1, you specifically recommend a one-hour emission  
 21 limit. I guess my -- a short averaging period, excuse  
 22 me, specifically to one hour.

23 Why do you say in this section that an  
 24 averaging period of one hour is recommended, but here  
 25 you say that there needs to be a shorter averaging

1 time with the modeling?

2 A. I think you can get more stringent and, in fact,  
3 require a shorter averaging period for monitoring that  
4 would be fine, that would preferable.

5 In general, there would be relationship  
6 between a 15-minute emission number and a 1-hour  
7 emission number if you have an excursion during a  
8 15-minute period that is going to be reflected in a  
9 higher 1-hour average as well.

10 So, yeah, I mean, if you had a, you know,  
11 the availability to take even shorter time period for  
12 monitoring that would be preferred.

13 That's typically done with things like  
14 opacity limits, for example, which might be specified  
15 as short as seven minutes. So if you could do that,  
16 that would be preferable. Probably one hour will  
17 provide a degree of protectiveness, which is suitable.

18 Q. But the shorter the averaging time the better, in  
19 general?

20 A. The better would depend to the attribute of concern.  
21 It's challenging, more challenging, to take  
22 high-accuracy measurements with a shorter averaging  
23 time. It would be more expensive, and so forth. So,  
24 overall, I'm trying to provide some balance between  
25 what I think is a reasonable balance between being

1 more than the reduction due to the decrease in load.

2 Q. If the emissions go up more than the reduction than  
3 the decrease in load --

4 A. In other words, at Gavin, for example, there are cases  
5 which I think are specified that look further in this  
6 section where at nighttime, for example, there is a  
7 decrease in load, and I think I specified where this  
8 is.

9 Q. I think you are talking about the first bullet point  
10 in the footnote in 2.3 --

11 A. That's correct. I didn't look at the footnote. So  
12 the volumetric flow decreased, as it says in the  
13 footnote, from 25 to 40 percent; but, in fact, the  
14 ppm's at the stack increased a larger percentage than  
15 the decrease in load.

16 The decrease in load will reduce the  
17 volumetric flow, which will reduce the plume rise, and  
18 so forth. And I didn't simulate this. The model was  
19 run with a constant emission rate. But in this case,  
20 this is an example of where that might happen.

21 Q. You based these numbers and this analysis on this  
22 Excel spreadsheet that is identified in the first  
23 nonitalicized paragraph of 2.3.3?

24 A. I believe I did.

25 Q. Do you know what that spreadsheet is?

1 protective and being feasible and technically  
2 responsible, and so forth.

3 Q. Back to page 14, on the third bullet point at the top,  
4 before we get to 2.3.3, you have: The dispersion  
5 modeling assumes a constant emission rate in near  
6 maximum stack gas exit velocity over the modeled  
7 period. As discussed below, this is clearly not the  
8 case, as much higher missions and lower exit  
9 velocities regularly occur, both of which will  
10 increase ground-level concentrations.

11 Have you simulated this in your modeling,  
12 where a higher emission -- higher emissions are  
13 associated with lower exit velocities?

14 A. No, I don't need to simulate that. The output of the  
15 model is proportional to the emission rate. So if, in  
16 fact, I know that emissions go up by, say, 10 percent  
17 and the ground-level concentrations will go up by 10  
18 percent, I don't need to simulate that.

19 Q. Have you ever seen a situation where lower loads on a  
20 unit produced higher ground-level concentrations?

21 A. For Gavin?

22 Q. Ever.

23 A. I can't recall for ever. Certainly we can run the  
24 modeling and simulate that the effect would, in fact,  
25 produce a higher concentration if the emissions go up

1 A. It's a spreadsheet giving parameters of emission rates  
2 during that particular year.

3 Q. Did you research any of the parameters in the  
4 spreadsheet, or was it just an output in parts per  
5 million?

6 A. Well, I researched -- I don't know exactly what you  
7 mean. But I looked at the spreadsheet, and it  
8 indicated over a period of time, which I don't recall  
9 exactly, perhaps it was most of the 2004 ozone season,  
10 estimates of what the SO3 concentration would be in  
11 the stack on an hourly basis. I think it was actually  
12 sheets in that spreadsheet that included the two units  
13 at Gavin.

14 So I'm aware that it's not monitored on an  
15 hourly basis. In fact, SO3 is monitored infrequently  
16 at the facility. So that is a modeled or estimated  
17 concentration of SO3, I'm aware of that.

18 Q. So it wasn't based on any kind of continuous emission  
19 monitor or --

20 A. As you are well aware, there is no continuous emission  
21 monitor of SO3 at this facility.

22 Q. Is there any available continuous emission monitor for  
23 SO3?

24 A. There are technology that promise, and perhaps can  
25 deliver on, SO3 measurements in a near-continuous

1 manner. As I'm aware also, I believe, in 2001 an  
 2 attempt was made to utilize one of these at Gavin and,  
 3 for a number of technical reasons, it didn't work out  
 4 very well. I don't believe that is a proof of  
 5 instrumentation or technology, for quite a few  
 6 reasons. We can get into that as well.

7 Q. Actually, I would like to.

8 You said they tried a continuous emission  
 9 monitoring in 2001, but it didn't work out. Do you  
 10 know what that was?

11 A. What the technology was?

12 Q. What the technology was.

13 A. I believe they used FTIR, which is Fourier Transform  
 14 Infrared Spectroscopy, F-O-U-R-I-E-R.

15 Q. And, to your understanding, why was that effort  
 16 ceased?

17 A. I'm sorry?

18 Q. To your understanding, why was that effort ceased?

19 A. Ceased?

20 Q. Ceased.

21 A. I think it was a trial, short-term trial, a couple of  
 22 weeks perhaps, and there were, sort of, no end of  
 23 technical snags, that meant results were unacceptable  
 24 to, I guess the client, being either AEP Ohio Power or  
 25 EPCRA. I'm not quite sure who was the sponsor of that

1 technologies like FTIR can certainly be applied in a  
 2 setting, if you are willing to spend the time and  
 3 money and resources to optimize that and make them  
 4 work. So just because there may not be a facility  
 5 with continuous monitoring, it doesn't mean that the  
 6 technology doesn't exist.

7 Q. Also on page 14, the third bullet point under 2.3.3,  
 8 you mentioned excursions well over the 20 parts per  
 9 million target are common.

10 Where do you get that 20 parts per million  
 11 is a target?

12 A. In fact, in further review of materials that have  
 13 become available since this report was put together,  
 14 in particular, I guess, the deposition of Rob Osborn,  
 15 he talks about targets per stack, per year, that vary  
 16 from this target.

17 This, I believe, I got by using the 2001  
 18 data, which talked about 19 to 22 ppm as being a  
 19 target, and so on.

20 I believe on some of the PowerPoints in the  
 21 other materials we looked at, there was explicitly  
 22 stated a 20 ppm, but I didn't document, unfortunately,  
 23 where that 20 ppm came from. But we are in the realm  
 24 of the range of things that are consistent with this  
 25 case.

1 particular trial.

2 It looks, in examining a little bit of the  
 3 data, a little bit of the results, that it wasn't what  
 4 I would say the best effort that could be put forward.

5 Q. Why do you say that?

6 A. Well, I don't recall all the details, but they had,  
 7 for example, issues with the sampling line melting,  
 8 with condensation problems, with other kinds of, you  
 9 know, fairly basic but troublesome issues that  
 10 resulted in malfunctions and failures. And had they  
 11 thought a little bit more about it, I think you would  
 12 be able to avoid those types of problems.

13 Q. Are you aware of any coal-fired electric utility in  
 14 the United States that uses a continuous emission  
 15 monitor for SO<sub>3</sub> or H<sub>2</sub>SO<sub>4</sub>?

16 A. I haven't researched that. I did see EPCRA has had a  
 17 program to try to evaluate those various technologies.  
 18 I think they focused on FTIR, but I can't say that I  
 19 know what is happening across the U.S., as is pretty  
 20 well understood. I mean, it's not been a concern  
 21 until recent years.

22 It takes some time to develop a technology  
 23 that is robust or hardened enough to be able to  
 24 provide the kind of performance that you like to see.

25 On the other hand, the promise of

1 Q. You said you reviewed Rob Osborn's deposition  
 2 transcript?

3 A. I skimmed it fairly quickly in the last couple of  
 4 days.

5 Q. Did you look at anyone else's deposition transcript?

6 A. Yeah, as I stated on the outset here, I reviewed a few  
 7 of the other depositions as well.

8 Q. Do you remember the names?

9 A. Let's see, the plant manager. His name -- I'm going  
 10 to need some help here.

11 Q. I can give you names and you can tell me whether or  
 12 not you have seen the deposition.

13 A. Sure.

14 Q. I won't try to make it harder. Jeff Lytle?

15 A. I skimmed his deposition.

16 Q. Jeff Navotny (phonetic)?

17 A. No, I don't believe I have seen that.

18 MR. BAILEY: We just got that.

19 BY MS. CRABTREE:

20 Q. I do think we just got that. We are still missing  
 21 one, which I know you couldn't have seen.

22 So Rob Osborn, Jeff Lytle. Did you look at  
 23 any of the CAP member depositions?

24 A. No, I don't think I have seen those.

25 Q. That would be Stinson, Mulford or Thompson.

1 A. In the past couple of weeks, no, I haven't seen those.  
 2 Q. Okay. On page 15, you say that your modeling is not  
 3 intended as a substitute for advanced modeling  
 4 techniques that can represent plume touchdowns or more  
 5 complete monitoring.

6 What other modeling techniques would you  
 7 use to more accurately model those things?

8 A. In this report I didn't get into detail and didn't do  
 9 a review of the kinds of modeling techniques that are  
 10 or could be appropriate.

11 What is fairly clear is that the conditions  
 12 that cause plume to descend to or near the ground in a  
 13 way which deviates from a Gaussian plume behavior is  
 14 represented in a model, like ISC, requires some  
 15 advance type of modeling technique.

16 Some of the computational fluid dynamic,  
 17 CFD, models, for example, might be able to do that.

18 These are fairly advanced types of  
 19 applications and well beyond the scope of what I would  
 20 be able to prepare for a report like this.

21 Q. How much effort would it take to run a CFD model?

22 A. It's hard to answer that. First of all, it requires  
 23 probably better meteorological data on-site than what  
 24 we have. And so, the first step would be to develop,  
 25 you know, better database.

1 causing a larger temperature gradient, conditions we  
 2 refer to as superadiabatic,  
 3 S-U-P-E-R-A-D-I-A-B-A-T-I-C.

4 These are likely responsible for some of  
 5 the touchdown conditions, or plume touchdown  
 6 conditions, in the fumigation case that we see at  
 7 Gavin facility.

8 At nighttime, those conditions are  
 9 generally less likely. We have meteorological  
 10 conditions prevailing that are characterized as stable  
 11 conditions, typically, where there is relatively  
 12 little dispersion.

13 In most cases, that will keep the plume  
 14 confined to a fairly narrowed vertical extent, meaning  
 15 that since the stacks are quite tall, if the plume  
 16 doesn't come to the ground level, the concentrations  
 17 are, essentially, in a fan or in a plume that is well  
 18 overhead, not reaching to ground level.

19 However, the topography has some rises in  
 20 the area and there can be conditions that still cause  
 21 a degree of subsidence in the plume. If that were to  
 22 happen, then the conditions could be higher at  
 23 nighttime.

24 It's not unusual to find for elevated point  
 25 sources like Gavin, that the highest ground-level

1 After the data exists, then it's a fairly  
 2 straightforward process, but a time consuming and  
 3 involved one, to develop the kinds of flow fields and  
 4 dispersion parameters that you need. But probably  
 5 most critically what you would like to have is some  
 6 validation that the model works as you intend it to  
 7 work. So that requires additional monitoring as well.  
 8 So all of those things add up to a fairly extensive  
 9 effort.

10 Q. Would you need to actually go out and do more  
 11 monitoring for that type of a model?

12 A. Strictly speaking, you can run a model without  
 13 additional monitoring. But, as I indicated, I would  
 14 like to be able to validate that the model -- as the  
 15 models get more complex, I like to have more assurance  
 16 that they work properly. So monitoring is one of the  
 17 better ways to get those assurances.

18 Q. I'm sorry, flipping back to 14 for a second. In the  
 19 footnote 9, you have: As nighttime dispersion is  
 20 often reduced from daytime, this may cause a triple  
 21 whammy.

22 What do you mean by nighttime dispersion is  
 23 reduced from daytime?

24 A. Unstable conditions generally exist during the daytime  
 25 when we have solar heating heating the ground surface,

1 concentrations occur at some distance from the  
 2 facility at locations of higher elevations.

3 In those types of facilities, or those  
 4 types of cases, often higher concentrations occur at  
 5 night.

6 Now, at Gavin, it's more complicated. We  
 7 have conditions occurring during the daytime that  
 8 bring the plume, due to these fumigation, or other  
 9 conditions during unstable classes, to the ground that  
 10 cause high concentrations that we have noted during  
 11 the daytime. But, of course, there hasn't been much  
 12 nighttime monitoring anyway, and most of the concern  
 13 has been very close to the facility, within a few  
 14 miles or kilometers, 10 kilometers, something like  
 15 that.

16 Q. You mentioned fumigation case, can you explain to me  
 17 what that is?

18 A. Yeah. Fumigation case might be thought of as  
 19 atmospheric conditions that essentially cause rampant  
 20 downward dispersion, bringing the plume to the ground  
 21 with limited dispersion above the stack height. So,  
 22 essentially, the plume is concentrated more at ground  
 23 level.

24 Q. Do you know what the current H<sub>2</sub>SO<sub>4</sub> level from Gavin  
 25 stack is?

1 A. In 2006?

2 Q. 2005.

3 A. You mean last year's numbers?

4 Q. Yes.

5 A. Target levels?

6 Q. Actual levels.

7 A. No, I don't believe anyone really knows. The monitoring is not continuous, and I haven't seen any specific monitoring for 2005. Based on the targets that I have seen, the concentrations, I think, are on the order of 10 to 14 ppm. And I think that comes out of Osborn's deposition, but I haven't seen any backup of that, so that's his opinion.

14 Q. Now, on page 15, in the second nonitalicized paragraph, the first sentence of that: SO<sub>3</sub> stack concentration of 17.5 parts per million is equal to an ambient H<sub>2</sub>SO<sub>4</sub> concentration of about 70,000 micrograms per cubic meter.

19 A. I'm sorry, which -- oh, paragraph 3.

20 Q. Yes. You refer to this as an ambient H<sub>2</sub>SO<sub>4</sub> concentration. Wouldn't this 70,000 micrograms per cubic meter actually be the concentration at the stack outlet?

24 A. Sure.

25 Q. That would disperse before it would touch down, if at

1 is 10 at one facility and, I think, 14 at the other.

2 Q. I understand. Paragraph 5, you mention a mixing height of 300 meters. Where does that come from?

4 Sorry, I'm in the paragraph that starts: The first approach utilizes --

6 A. Right, yeah. I selected a somewhat higher than the Gavin stacks.

8 Q. Why?

9 A. I'm illustrating here the magnitude of the emissions and the need for a high dilution factor to produce ground-level concentrations that are very low. These are a number of examples to illustrate the kinds of scenarios that can -- well, there are number of scenarios that are designed to illustrate the dilution factors that we have. So I'm picking numbers that I think will illustrate those points.

17 Q. Would you expect that to be the actual mixing height?

18 A. No.

19 Q. What would you expect to be the actual mixing height on a high-ozone day?

21 A. Mixing height also vary over the day and night, and over the season. And the answer is, it depends on many factors. In general, in this part of the region in the summer, morning mixing heights are probably on the order of 1,000 meters, something like that.

1 all, in the surrounding area, correct?

2 A. Ideally, we like a lot of dispersion.

3 Just to clarify one thing on my previous answer with respect to what the actual emissions are, I think it's important to recognize that these emissions are likely to vary from hour to hour and season to season, and so forth.

8 When I indicated that I -- in my review of Osborn's deposition, that he said the targets were 10 to 14, this is sort of a long-term average that represents, again, a predicted output. So fluctuations are going to occur from that number on a short-term basis that will cause levels potentially to be considerably higher or, possibly, considerably lower.

16 Q. That 10 to 14 he designated was during the operation of SCRs; is that correct?

18 A. That's my understanding.

19 Q. Okay.

20 A. But that 10 to 14 is not the range I'm talking about; rather, is the estimate of the expected output from one stack and from the second stack.

23 In other words, short-term fluctuations can cause it to, say, go to 20, to 30, or go to 5, but on the long-term average, his opinion is that the average

1 Later in the day -- actually, that's kind of a afternoon-time measurement.

3 At nighttime, they will drop. In the afternoon, they will rise. And I don't recall the exact number. It's going to depend on the site that you look at, but it -- you know, that's an average.

7 For a particular period of time, it can certainly be much lower. You can have mixing heights that are 300, 200 meters, whatever. So it's going to vary. But the expectation is, thankfully, we have a much higher mixing height, otherwise we would have very severe pollution problems very frequently.

13 Q. The bowl that you described that the plants are kind of sitting in, for purposes of illustration, it seems like you are using what you call a simple closed-box model. In actuality, wouldn't winds be flowing through that bowl?

18 A. Yes, exactly. That's the second -- the next paragraph --

20 Q. Okay.

21 A. -- where I assume wind is blowing through the box.

22 Q. Okay. Where you say -- where it says the third approach, the last paragraph on this page, you said: The necessary dilution factor of 583 is obtained by increasing the cylinder's diameter to 309 meters.

1 Is it your opinion that the diameter of the  
 2 stacks at Gavin should be increased?  
 3 A. No.  
 4 Q. Okay. Obviously not to 309 meters, but at all?  
 5 A. They could probably accommodate that on the site, but  
 6 it's not at all the intent to do anything like that at  
 7 all.  
 8 Q. Again, this was just illustrative?  
 9 A. No. I think you are misinterpreting what I'm trying  
 10 to do here. The idea here is to visualize the plume  
 11 as leaving the stack, which is 12.8 or 42 feet in  
 12 diameter and, essentially, turning horizontal. So it  
 13 comes out vertically and then turns horizontally.  
 14 And just as a way to imagine what the plume  
 15 would look like and how large the plume would have to  
 16 be to produce, let's say, acceptable  
 17 ground-level concentrations. It's just a way to  
 18 illustrate the dilution ratio that is needed.  
 19 Q. Okay.  
 20 A. Increasing the diameter to that magnitude would cause,  
 21 in fact, things to get much worse.  
 22 Q. Why do you say that?  
 23 A. Well, assuming you had the amount of cement, and  
 24 everything else that it would take to build a  
 25 structure like that or, I guess, that would be a

1 expected?  
 2 MS. CRABTREE: Yes.  
 3 MR. BAILEY: As long as it doesn't affect  
 4 your time to end tomorrow.  
 5 MR. BAILEY: Off the record for a second.  
 6 (Deposition adjourned at 5:10 p.m.  
 7 Signature of the witness was requested)

1 stadium, with a very narrow aperture, you would be  
 2 looking down, releasing a plume, then the velocity  
 3 that comes out that plume would be minuscule.  
 4 As soon as it would come out, it would be  
 5 picked up in what we call downdrafts, or plume  
 6 downwash, we would likely bring it down to the ground;  
 7 and that's exactly the wrong thing to do.  
 8 Q. Is it your opinion that the stacks at Gavin should be  
 9 higher?  
 10 A. I didn't offer an opinion with respect to that.  
 11 Q. Okay.  
 12 A. In this -- in this description here, these are  
 13 examples that are using what is there at present.  
 14 Increasing a stack height, of course, would tend to  
 15 lower ground-level concentrations. But then you have  
 16 GEP concerns to deal with at EPA.  
 17 MS. CRABTREE: It's 5:00 now. I have about  
 18 20 minutes until we would get to health effects. Do  
 19 you want to go that far or -- I'm at a stopping point  
 20 now, if you want.  
 21 MR. BAILEY: Are you ready to stop?  
 22 THE WITNESS: It's overtime for me.  
 23 MR. BAILEY: You got it.  
 24 THE WITNESS: I don't remember.  
 25 MR. BAILEY: Are you progressing as you

1 CERTIFICATE OF NOTARY

3 ) SS  
4 COUNTY OF OAKLAND )

5  
6 I, Karen Klerekoper, a Notary Public in  
7 and for the above county and state, do hereby certify  
8 that the above deposition was taken before me at the  
9 time and place hereinbefore set forth; that the  
10 witness was by me first duly sworn to testify to the  
11 truth, and nothing but the truth; that the foregoing  
12 questions asked and answers made by the witness were  
13 duly recorded by me stenographically and reduced to  
14 computer transcription; that this is a true, full and  
15 correct transcript of my stenographic notes so taken;  
16 and that I am not related to, nor of counsel to either  
17 party nor interested in the event of this cause.
